

LoggerStartUp()

Synopsis

```
int LoggerStartUp()
```

Description

Initializes internal data structure and starts the logger services.

LoggerStartUp() returns 0 on success and -1 on error.

Example Usage

This function is failed safe which means when an error occurs the application can continue processing.

```
If( LoggerStartUp() == -1 )
{
    printf("Refer to additional error codes for further details\n");
}
```

Error Codes

Error codes are written to the following files, where the <cpid> is the application process id number:

- /tmp/<cpid>-LoggerAppsMessage.txt
- \$LOGGER_HOME_PATH/LoggerOutput/<cpid>-LoggerAppsMessage.txt

107, 108, 109, 110, 111	Invalid message grouping id=value pair.
112, 113, 114	Invalid message severity level id=value pair.
118	Environment variable <code>LOGGER_HOME_PATH</code> is not defined.
119	Failed to create apps message log output file.
120, 130	Failed to get process executable name.
131	Failed to determine adjustable configuration data.
132, 133, 121, 122, 123, 124, 125, 126, 127, 128, 129	Failed to validate LoggerMessageDefines.txt file.
134	Failed to create log file.
102, 101, 103	Only one application instance using the Logger is permitted. Failed to determine if another application is using the Logger.
